Data Management Plan – Tamara Pico

Research results from the proposed study will be published in peer-reviewed journals. Furthermore, progress on this project will be reported at the AGU Fall Meeting each year.

The proposed study will generate several types of electronic data. Ice histories and sea-level output will be available for download on GitHub, after publication. In addition scripts written in Matlab and Python will be freely available, archived on GitHub, after publication. Access to other data will be available as supplementary materials to any publications resulting from the proposed research.

The majority of electronic data produced will be shared via publications and supplementary material. Additional data and code to produce electronic data will be available upon request. We will encourage free sharing of data following publication, as long as publication is cited.
